

Expense Tracker & Predictor – Project Report

1. Introduction

In daily life, we often spend money without keeping proper track of it. This project helps in recording expenses, understanding spending habits, and predicting future expenses using a simple machine learning model.

2. Objective

- To track daily expenses easily
 - To visualize spending using graphs
 - To predict future expenses
 - To improve personal financial planning
-

3. How it Works

First, the user's expense data (date, category, amount) is stored.

Then, the data is shown in a graph to understand spending patterns.

After that, a simple machine learning model (Linear Regression) is used to predict future expenses based on past data.

4. Tools Used

- Python
 - pandas
 - matplotlib & seaborn
 - scikit-learn
-

5. Output

- A graph showing expenses
- Predicted expense for a future date

- Model accuracy displayed in the console
-

6. Advantages

- Simple and easy to use
 - Helps manage money better
 - Useful real-life application of ML
-

7. Limitations

- Works on small sample data
 - Prediction is not highly accurate
-

8. Conclusion

This project shows how machine learning can be used in everyday life. It is a basic but useful tool to track and predict expenses, and it can be improved further for real-world use.
